Edge Neighbors Node

The *Edge Neighbors* node outputs topology information relating to each edge of a mesh.

Inputs

This node has no inputs.

## Properties

This node has no properties.

Outputs

Face Count

The number of faces that use the edge as one of their sides. When the value is one, the edge is a non-manifold boundary edge. Alternatively, when the value is zero, the edge is a loose edge, not used by any faces.

Examples

Using the *Face Count* output to create a curve on a mesh's boundary edges.
